The present nucleotide sequence is that of an open reading frame encoding chloroplast-targeted chorismate pyruvate lyase (CPL) fusion protein TP-CPL (see AABA)1841-42) was used to generate a DNA (Fragment corresponding to the transit peptide of tomato Rubisco small fragment corresponding to the transit peptide of tomato Rubisco small could be fired a maino acid residues of mature Rubisco. The DNA fragment was ligated into pET44-CPL, which carries the Escharichia coli corporate reading frame (see ABA91837). The TP-CPL construct is an example of expression cassettes of the invention that are designed for the high-corporate releases a novel polypeptide (see AM950961) that has full enzyme activity, converting chorismate to pHBA. AM950961) that has full enzyme activity, converting chorismate to pHBA. CC claimed plant comprising a CPL expression cassette is selected from solve and parts. Assable and converting chorismate to pHBA. CC claimed plant comprising a CPL expression cassette is selected from solve antiev, bean, pea, rye, flax or a forage grass. PHBA is a monomeric component of liquid crystal polymers which have application in the catchidal and other industries. (Updated on 29-AUG-2003 to etandardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene (SNG1, sinapoylglucose accumulator 1) encoding sinapoylglucose accumulator 1) encoding sinapoylglucose.malate sinapoyltransferase (SNT). SNT catalyses the substitution of a glucose moiety on a glycosylated aromatic acid with a malate moiety to form a malate conjugated aromatic acid. The enzyme is useful for producing malate conjugated aromatic acids, carboxylt acid conjugated aromatic setters. The malate conjugated aromatic setters. The present sequence representing the ORF (open reading frame) for TP-CPL (tomato Rubisco small subunit precursor for rbcS2-Escherichia coli chorismate pyruvate lyase (CPL)) fusion protein is described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to the isolation of Arabidopsis thaliana

The invention relates to a novel isolated nucleic acid that encodes a UDP glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (p-hydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a monomer for liquid crystal polymers (LCPB) and starting material for methylparaben. Methylparaben is a preservative commonly used in the food and cosmetic industries. The encoded enzymes may be used for in vitro production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the tentomodel contains a coli chimeric TP-CPL (chorismate pyruvate lyase) DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 AGCATGGTTGCACCTTTCACTGGTCTCAAATCTTCAGCCACTTTCCCTGTTACAAAGAAG 120

The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin, 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relates upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid (p-hydroxybenzoic acid, pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce carbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-bydroxycinamayorl-CoA hydratases/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidan, antimicrobial agent, anti-confinammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is tomato rubisco small subunit precursor (rbc62) transit peptide (chloroplast transit peptide; TP)-Escherichia coli CPL chimeric DNA. This sequence is present in the E. coli expression vector construct pET24a-TP-CPL.
                                                                                                                                                                                                                                                                                                                                                                                     ô

The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid (p-hydroxybenzoic acid, pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lysse (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (CPL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapailosis pHBA 1-hydroxylase (PHB 1-H) - Bscherichia coli chorismate pyruvate lysse (CEL) and Arabidopsis thaliana UDP-glucosyltransferase (UGT72B1) chimeric DNA.
                                                                                                                                                                                                                                                                                                                                                Hydroquinone glucoside; arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside; chorismate pyruvate lyase; CPL; 4-hydroxycinnamoyl-COA hydratase/lyase; HCHL; gene expression; hydroquinone; antiseptic; transgenic plant; genetically engineered microorganism; antioxidant; antimicrobial agent; anti-inflammatory agent; carcinogenic inhibitor; melanoma; cytostatic; neoplasm; pHBA 1-hydroxylase; pHBA 1-H; pHBA; para-hydroxybenzcic acid; p-hydroxybenzcic acid; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing hydroquinone glucoside in a green plant comprises growing a green plant having nucleic acid fragments and chorismate pyruvate lyase expression cassette.

The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-b-glucopyranoside) in genetically modified green plants and microoraganisms. The method relies upon transgenic plants or genetically modified microorganisms by produce increased levels of the initial substrate para-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyravate lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratasel/yase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-hidamency agent and inhibitor of carcinogenesis (melanoma). The present sequence is Escherichia coli chorismate pyruvate lyase (CPL) DNA. This sequence is found in the B. coli expression vector construct

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin, 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxypenzoic acid, pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapsilosis pHBA lightoxylass (PHB 1-H) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids acid (pHB) which comprises transforming microorganisms with plasmids carying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubiC gene encoding chorismate pyruvate lyase, arof structural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phe), tkth gene encoding transketolase, ppsh gene encoding phosphoenolpyruvate (pEP) synthase, arof gene encoding chorismate synthase, arof gene encoding chorismate synthase and arob converting chorismate to a selected aromatic compound. The method is used for converting thorismate to a selected aromatic compound. The method is aromatic compounds, particularly p-hydroxybenzoic acid. The present sequence is ubiC gene which encodes chorismate pyruvate lyase that

The selected genes of the common aromatic pathway of the invention includes ubiC gene encoding chorismate pyruvate lyase, arog the invention includes ubiC gene encoding chorismate pyrubase aroc gene encoding phosphoenolpyruvate (PEP) synthase, aroc gene encoding chorismate synthase arot gene encoding shikimate kinase II, arch gene encoding 5-enolpyruvoylahikimate-3-phosphate (BPSP) synthase and arob cene encoding 3-dehydroquinate (DHQ) synthase. The method is used for converting chorismate to a selected aromatic compounds. Particularly p-hydroxybenzoic acid. The present aromatic compounds, particularly p-hydroxybenzoic acid. The present aromatic compounds, particularly p-hydroxybenzoic acid. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  306

                                                                                                                                                                                                                                                                                         Transgenic plants containing a bacterial gene which encodes an enzyme able to catalyse prodn. of an antiviral bactericidal, fungicidal or insecticidal factor are new. A preferred gene is ubic from E.coli (AAQ92409) which codes for chorismate-pyruvate lyase (AAR74742). The lyase catalyses conversion of chorismate to p-hydroxybenzoic acid and transgenic tobacco plants which express the active enzyme are resistant to tobacco mosaic virus
                                                                                                                                                               bacterial DNA coding for enzyme catalysing prodn. of resistance factor - contg. e.g. antiviral p-hydroxy-benzoic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TTATGTGCCGATGGTGAACCGTGGCTTGCCGTCGTACCGTCGTTCCTGTGTCAACGTTA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       859
           The present sequence comprises the ubiquinone biosynthetic enzyme genes ubiC and ubiA, which were cloned from the chromosomal DNA of B. coli (Kohara map phage DNA bank 1FB (634); Cell 50, 495-508 (1987)). A large amt. of ubiquinone-10 can be produced by culturing photosynthetic bacteriat transformed with the novel plasmid pRSPAC, which contains the ubiC and ubiA genes and the glutamate synthase gene promoter, specifically the Rhodobacter capsulatus transformant MC9R/pRSFAC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of the coding region of the Escherichia colistrain W3110 ubic gene in expression construct pET24a. The gene encodes continuate pyruvate lyses (CPL, see AAW$1086). It was obtained by PCRR amplification of strain W310 genomic DNA using primers (see ABA$1839-40) based on the published B. coli ubic gene. The CPL open reading frame is used in an expression cassette designed for the high-level production of phydroxybenzoic acid (pHBA) in green plants. The expression cassette comprises the CPL coding sequence operably linked to a promoter capable of driving protein expression in higher plants. The cassette also has a sequence encoding a chloroplast transit peptide, its natural cleavage of driving protein expression in higher plants. The cassette also has a sequence encoding a chloroplast transit peptide, its natural cleavage of the chloroplast and aids in its uptack into the organelle. The creaminus of CPL. The chloroplast targeting sequence targets the foreign protein to the chloroplast targeting sequence targets the foreign cleavage site is unique to the transit peptide, and cleavage of the claavage site is unique to the transit peptide, and cleavage of the chloroplast and as sell enzyme activity, comprising the mature CPL censyme and a small portion of transit peptide donor (see AAM$5051). A plant comprising the CPL expression cassette is claimed, and may be component of liquid crystal polymers which have application in the component of liquid crystal polymers which have application in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô

The invention relates to a novel isolated nucleic acid that encodes a UDP -glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (p-hydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a monomer for liquid crystal polymers (LPBP) and starting material for methylparaben. Methylparaben is a preservative commonly used in the food and cosmetic industries. The encoded enzymes may be used for in vitro production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the Escherichia coli chorismate pyruvate lyase (CPL, UDiC) DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              247 CTGGATCCGCAACTGCTCGACTGCTGTTGCTGGAGGATTCCATGACAAAACGTTTTGAA 306

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                           The present invention relates to the isolation of Arabidopsis thaliana gene (SNG1, sinapoylglucose accumulator 1) encoding sinapoylglucose accumulator 1) encoding sinapoylglucose:malate sinapoyltransferase (SMT). SMT catalyses the substitution of a glucose moiety on a glycosylated aromatic acid with a malate moiety to form a malate conjugated aromatic acids. Carboxyllo acid useful for producing malate conjugated aromatic acids, carboxyllo acid aromatic acids or aromatic seters. The malate conjugated aromatic acids are useful in the synthesis of various polymers. The present sequence representing the ORF (open reading frame) for chorismate pyruvate lyase (CPL) in pBT248 Bscherichia coli expression construct is described in the examples of the present invention

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed cativity of (II) as useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and anno acid sequences. Ass64197-AAS94564 represent novel human diagnostic coding sequences. Ass64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this electronic format directly from MIPO at the printed specification, but was obtained in electronic format directly from MIPO at Everyone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing aromatic acid conjugates, involves contacting glycosylated aromatic acid with malate, alpha-hydrocarboxylic acid or alcohol in the presence of sinapoylglucose:malate sinapoyltransferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SNG1; sinapoylglucose accumulator 1; SMT; aromatic ester; plant; sinapoylglucose:malate sinapoyltransferase; glycosylated aromatic acid; malate conjugated aromatic acid; polymer synthesis; ubic; TP-CPL; gene; carboxylic acid conjugated aromatic acid; chorismate pyruvate lyase; tomato Rubisco small subunit precursor; rbcS2; mutant; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            gene (SNG1, sinapoylglucose accumulator 1) encoding sinapoylglucose:malate sinapoyltransferase (SMT). SMT catalyses the substitution of a glucose moiety on a glycosylated aromatic acid with smalate moiety to form a malate conjugated aromatic acid. The enzyme is useful for producing malate conjugated aromatic acids, carboxylic acid conjugated aromatic acids, carboxylic acid conjugated aromatic acids or aromatic esters. The malate conjugated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to the isolation of Arabidopsis thaliana

                                                                                                                                                                                                                                                                                                                                                                                                               The present nucleotide sequence is that of an open reading frame encoding chloroplast-targeted chorismate pyravate lyase (CPL) fusion protein TP-CPL (see AABA50859). PCR (see ABA91841-42) was used to generate a DNA fragment corresponding to the transit peptide of tomato Rubisco small subunit and the first 4 amino acid residues of mature Rubisco. The DNA cragment was ligated into pET24a-CPL, which carries the Escherichia coli CPL open reading frame (see ABA91837). The TP-CPL construct is an example of expression cassettes of the invention that are designed for the high-cole evel production of p-hydroxybenzoic acid (pHBA) in higher plants. Cleavage of TP-CPL in the chloroplast releases a novel polypeptide (see AAM50961) that has full enzyme activity, converting chorismate to pHBA. A CC claimed plant comprising a CPL expression cassette is selected from soybean, rapeseed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, rice, Arabidopsis, sugarbeet, sugarcane, canola, millet, bean, pea, rye, flax or a forage grass. PHBA is a monomeric component of liquid crystal polymers which have application in the automotive, electrical and other industries. (Updated on 29-AUG-2003 to standardise OS field)

aromatic acids are useful in the synthesis of various polymers. The present sequence representing the ORF (open reading frame) for TP-CPL (tomato Rubisco small subunit precursor for rbcS2-Escherichia coli chorismate pyruvate lyase (CPL) i fusion protein is described in the examples of the present invention

```
The invention relates to a novel isolated nucleic acid that encodes a UDP glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (phydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a monomer for liquid crystal polymers (LCPB) and starting material for methylparaben. Methylparaben is a preservative commonly used in the food and cosmetic industries. The encoded enzymes may be used for in vitro production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 231

The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid (p-hydroxybenzoic acid (p-hydroxybenzoic acid phans) in a biosynthetic pathway to produce

                                                                                                                                                                                                                                                                                                                                       20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hydroquinone glucoside; arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside; chorismate pyruvate lyase; CPL; 4-hydroxycinnamoyl-CoA hydratase/lyase; HCHL; gene expression; hydroquinone; antiseptic; transgenic plant; genetically engineered microorganism; antioxidant; antimicrobial agent;
arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-hydroxycinnamoy1-coA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is tomato rubisco small subunit precursor (rbcS2) transit peptide (chloroplast transit peptide; TP)-Escherichia coli CPL chimeric DNA. This sequence is present in the E. coli expression vector construct pBT24a-TP-CPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     C. parapsilosis pHB 1-H- E. coli CPL- A. thaliana UGT72B1 chimeric DNA.

```
The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin, 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxypenzoic acid (p-hydroxypenzoic acid, pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyravate lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (CPL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapsilosis pHBA lhydroxylase (PHB IH)-Escherichia coli chorismate pyrivate lyase (CPL) and Arabidopsis thaliana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing hydroguinone glucoside in a green plant comprises growing a green plant having nucleic acid fragments and chorismate pyruvate lyase

                                                                                                                                                                                                                                                                  85
able to catalyse prodn. of an antiviral, bactericidal, fungicidal or insecticidal factor are new. A preferred gene is ubic from E.coli (AAQ92409) which codes for chorismate-pyruvate lyase (AAR74142). The lyase catalyses conversion of chorismate to p-hydroxybenzoic acid and transgenic tobacco plants which express the active enzyme are resistant to tobacco mosaic virus

The present sequence is that of the coding region of the Escherichia colistrain WillO ubic gene in expression construct pET34a. The gene encodes chorismate pyruvate lyses (CPL, see AAMS0968). It was obtained by FCR amplification of strain WillO gene, in the sing primers (see ABAS1839-40) based on the published E. coll ubic gene. The CPL open reading frame is used in an expression cassette designed for the high-level production of phydroxybenzoic acid (pHBA) in green plants. The axpression cassette comprises the CPL coding sequence operably linked to a promoter capable of driving protein expression in higher plants. The cassette also has a sequence encoding a chloroplast transit peptide, its natural cleavage site, and a small portion of a transit peptide donor protein fused to the N-terminus of CPL. The chloroplast targeting sequence targets the foreign protein to the chloroplast and aids in its uptake into the organelle. The cleavage site is unique to the transit peptide, and cleavage of the cleavage site is unique to the transit peptide, and cleavage of the cleavage site is unique to the transit peptide, and cleavage of the cleavage site is unique to the transit peptide donor (see AAMS0961). A plant comprising the CPL expression cassette is claimed, and may be solven, rapeseed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, rice, Arabidopsis, sugarbeet, sugarcane, canola, aulilet, bean, pae, rye, flax or a forage grass. pHBA is a monomeric component of liquid crystal polymers which have application in the component of liquid crystal polymers which have application in the component of liquid crystal polymers which have application in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 CTGGATCCGCAACTGCTCGACTGGCTGTTGCTGGAGGATTCCATGACAAACGTTTTGAA 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        45

substitution of a glucose molety on a glycosylated aromatic acid with a malate molety to form a malate conjugated aromatic acid. The enzyme is useful for producing malate conjugated aromatic acids, carboxylic acid conjugated aromatic acids, carboxylic acid aromatic acids or aromatic esters. The malate conjugated aromatic acids are useful in the synthesis of various polymers. The present sequence representing the OPF (open reading frame) for chorismate described in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LeuCysAlaAspGlyGluProTrpLeuAlaGlyArgThrValValValProValSerThrLeu 105

                                                                      g
                                                                                                  ð
                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated mucleic acid that encodes a UDP-glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a high-volume chemicals or materials, such as pHBA (p-hydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a monomer for liquid crystal polymers (LCPB) and starting material for methylparaben. Methylparaben is a preservative commonly used in the food and commettic industries. The encoded enzymes may be used for in the production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the Escherichia coli chorismate pyruvate lyase (CPL, UDiC) DNA of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzolc acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial
                                                                                                                                                                                                                                                                                                         480
                                                                                                                         145

protein chorismate pyruvate lyase (CPL) or by the expression of 4-hydroxyciunamoyl-CoA hydratase/lyase (HFLL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Escherichia coli chorismate pyruvate lyase (CPL) DNA. This sequence is found in the E. coli expression vector construct pET244(+).
                                                                                                                                                                                                                                                                                                      9

The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids carying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubic gene encoding chorismate pyruvate lysse, aroc structural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phb), tkth gene encoding transketolase, ppsh gene encoding phosphoenolpyruvate (pEP) synthase, aroc gene encoding chorismate synthase, arol gene encoding shikimate kinase II, aroh gene encoding chorismate to a selected aromatic compound. The method is used for converting chorismate to a selected aromatic compound. The method is aromatic compounds, particularly used for the production of commercially acceptable levels of aromatic compounds, particularly p-hydroxybenzoic acid. The present sequence is ubiC gene which encodes chorismate pyruvate lyase that
                                                                                                                                                                                                                                                                 Producing aromatic compounds, especially commercially acceptable levels of p-hydroxybenzoic acid, comprises developing genetically engineered bacteria that carry selected genes of the common aromatic pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MetSerHisProAlaLeuThrGlnLeuArgAlaLeuArgTyrCysLysGluIleProAla

```
The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids carrying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubic gene encoding chorismate pyruvate lyase, arog structural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzwme synthase (phb), tkth gene encoding transketolase, ppsA gene encoding phosphoenolpyruvate (PEP) synthase, arcC gene encoding chorismate synthase arol gene encoding shiximate kinase II, arcA gene encoding converting 5-enolypruvoylahiximate-3-phosphate (BEPS) synthase and arcB gene encoding 3-dehydroquinate (DHQ) synthase. The method is used for converting chorismate to a selected aromatic compound. The method is aromatic compounds, particularly used for the production of commercially acceptable levels of aromatic compounds, particularly p-hydroxybenzoic acid. The present sequence is pME2 plasmid which comprises ubic, arod, tkth and ppsA genes involved in the aromatic pathway
                                                                                                                                                     800
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chorismate pyruvate lyase; ppsA; phosphoenolpyruvate synthase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence comprises the ubiquinone biosynthetic enzyme genes ubic and ubiA, which were cloned from the chromosomal DNA of E. coli (Kohara map phage DNA bank IF8 (634), Cell 50, 495-508 (1987)). A large amt. of ubiquinone-10 can be produced by culturing photosynthetic bacteria transformed with the novel plasmid pRSFAC, which contains the ubic and ubiA genes and the glutamate synthase gene promoter,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genes coding for ubiquinone biosynthetic enzymes - useful for prodn. of ubiquinone-10 by transformed photosynthetic bacteria.

The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (PCH) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapsilosis pHBA 1-hydroxylase (PHB 1-H) and Escherichia coli chorismate pyruvate lyase (CPL) chimeric DNA.

The invention relates to isolated polymucleotide (I) and polypeptide (II) conception (IX) brimers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) is useful in gene therapy techniques to restore normal constitution of II) is useful in gene therapy techniques to restore normal constitution of the constitution of the product of galants it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food constitution in the binding partners are useful in medical imaging of sites expressing (II). (II) and (III) are useful for treating disorders of involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in capping, identification of mutations copypeptide for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this continic format directly from WIPO at seamence. The mino int forth/nublished for seminoses.

                                                                                                                        Transgenic plants containing a bacterial gene which encodes an enzyme able to catalyse prodn. of an antiviral, bactericidal, fungicidal or insecticidal factor are new. A preferred gene is ubic from E.coli (AAQ92409) which codes for chorismate-pyruvate lyase (AR74742). The lyase catalyses conversion of chorismate to p-hydroxybenzoic acid and transgenic tobacco plants which express the active enzyme are resistant
                                              Transgenic plants with increased content of resistance factor - contg. bacterial DNA coding for enzyme catalysing prodn. of resistance factor, e.g. antiviral p-hydroxy-benzoic acid.

The present sequence is that of the coding region of the Escherichia colistrain Willo ubic gene in expression construct pET24a. The gene encodes chorismate pyruvate lyses (CPL, see AAM50968). It was obtained by PCR amplification of strain Will genomic DNA using primers (see ABA91839-40) based on the published E. coli ubic gene. The CPL open reading frame is used in an expression cassette designed for the high-level production of p-hydroxybenzoic acid (PHBA) in green plants. The expression cassette comprises the CPL coding sequence operably linked to a promoter capable of driving protein expression in higher plants. The cassette also has a comprises the CPL coding sequence operably linked to a promoter capable of driving protein expression in higher plants. The cassette also has a congrises the CPL. The chloroplast transit peptide donor protein fused to the N-terminus of CPL. The chloroplast targeting sequence targets the foreign protein to the chloroplast targeting sequence targets the foreign colavage site is unique to the transit peptide and cleavage of the chloroplast and aids in its uptake into the organelle. The cleavage site is unique to the transit peptide, and cleavage of the chloroplast and aids in its uptake into the organelle. The colypeptide that has full enzyme activity, comprising the mature CPL conzyme and a small portion of transit peptide donor (see AAM50961). A plant comprising the CPL expression cassette is claimed, and may be solyhem, rice, hand, pea, rye, flax or a forage grass pHBA is a monomeric component of liquid crystal polymers which have application in the constructive, electrical and other industries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing para-hydroxy benzoic acid in green plant, comprises expression of unique expression cassette containing gene encoding chorismate pyruvate lyase operably linked to specific chloroplast targeting
                                                                                                                                                                                                                                                                                                                    /*tag= a

The present invention relates to the isolation of Arabidopsis thaliana gene (SNG1, sinapoylglucose accumulator 1) encoding sinapoylglucose malate sinapoyltransferase (SNT). SNT catalyses the sinapoylglucose malate sinapoyltransferase (SNT). SNT catalyses the substitution of a glucose moiety on a glycosylated aromatic acid with a malate moiety to form a malate conjugated aromatic acid. The enzyme is useful for producing malate conjugated aromatic acids, carboxylic acid conjugated aromatic acids or aromatic esters. The malate conjugated aromatic acids are useful in the synthesis of various polymers. The present sequence representing the ORF (open reading frame) for chorismate pyruvate lyase (CPL) in pET24a Escherichia coli expression construct is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated nucleic acid that encodes a UDP -glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (phydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a methylparaben. Methylparaben is a preservative commonly used in the food and cosmetic industries. The encoded enzymes may be used for in vitro production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the Escherichia colismate pyruvate lyase (CPL, UDiC) DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20

  hydroguinone glucoside (arbittin, 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbitin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbitin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Escherichia coli chorismate pyruvate lyase (CPL) DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           240

The present nucleotide sequence is that of an open reading frame encoding chloroplast-targeted chorismate pyruvate lyase (CPL) fusion protein TP-CC chloroplast-targeted chorismate pyruvate lyase (CPL) fusion protein TP-CC CPL (see ABM50959). PCR (see ABM5091841-42) was used to generate a DNA fragment corresponding to the transit peptide of tomato Rubisco small subunit and the first 4 amino acid residues of mature Rubisco. The DNA fragment was ligated into pET24a-CPL. Which carries the Escherichia coli CCPL open reading frame (see ABM59137). The TP-CPL construct is an example CC expression cassettes of the invention that are designed for the high-CC cleavage of TP-CPL in the chloroplast releases a novel polypeptide (see AM50961) that has full enzyme activity, converting chorismate to pHBA. A claimed plant comprising a CPL expression cassette is selected from soybean, rapeseed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, rice, Arabidopsis, sugarbeet, sugarcane, canola, millet, bean, pea, rye, flax or a forage grass. PHBA is a monomeric component of liquid crystal polymers which have application in the automotive, electrical and other industries. (Updated on 29-AUG-2003 to
